

## Oshawa Overhead Crane Safety Training

Oshawa Overhead Crane Safety Training - The overhead crane safety training program is meant to equip the operators with the right skills and knowledge in the areas of: crane safety precautions, accident avoidance, materials handling, and equipment and stock protection. Each of the trainees will get to learn on many kinds of overhead cranes, their capabilities and their uses in different settings. For operators who are licensed and trained, the shift in liability moves to the operator from the company. Hence, the program emphasizes individual operator responsibilities.

The operators in the overhead safety training program would be given instruction on the correct techniques for carrying out inspections: the more detailed in-depth inspection and the pre-shift inspection. These are vital every day routines that should be logged. Correctly recorded pre-shift checks help to protect the company from liability in the event of an accident. Pre-shift checks likewise prevent costly repairs, accidents and damage. Operators learn how to designate a specific individual to carry out checks, how to maintain the log book and how to report problems.

Checks should be carried out often and documented properly. The following should be inspected while watching for usual problems: increase in the throat opening, hooks for cracks, hoist ropes for corrosion, degree of twist, worn wires, loss of diameter, broken wires, bird caging and kinks, chains for gouges and nicks, heat and chemical damage, corrosion and cracks, twists, excessive wear, distortion, pits, stretching, damage caused by extreme heat.

Operators learn proper rigging methods in this course. Rigging includes understanding the manufacturer's data plate, determining the material weight to be lifted, selecting the gear, and using safe practices to secure the load. The program includes in detail the following: safe working loads, and the capacities of chains, ropes, shackles, slings and hooks.

It is important to know who may operate the cranes at your facility, the job's physical requirements, and operator credentials required for specialized job and permits. Safety is a priority when utilizing in the vicinity of pedestrian traffic.

Safe crane use consists of duties such as checking for hydraulic leaks, undertaking visual inspections, testing the controls, checking the safety guards, examining the hook and hoist rope, limit switches and braking mechanisms. Proper reporting methods are vital. These topics are all covered in depth in the course.

Proper lifting and moving methods with hoists and cranes are included in the course. Operators will become competent in hand signals. Training includes how to attach the load, raise the load, abort a lift, set the load and unhook the slings.

The steps included with moving the load, consists of: stopping and starting procedures, controlling and guiding the load, observing working conditions and working with signals. In the event of power failures, the operator would need to know how to proceed. The program covers techniques for removing the slings and lowering the load, storage of equipment, parking the crane, and securing an outdoor and indoor crane.
